

FACILITATOR ONLY

GitHub and portfolios

A practical introduction, followed by time to work and ask questions. All times below start at Reggie's handoff. No timing appears on student screens.

WHEN	SLIDE	WHAT TO DO
00-01	01	GitHub and portfolios
01-03	02	Fluency, legibility, and reach
03-06	03	EXERCISE: What could you work on?
06-08	04	A job description can suggest your next project
08-09	05	Choose projects that show different strengths
09-11	06	Explain the question, your approach, and the result
11-13	07	Build a presence that helps someone understand you
13-14	08	Decide what you can share
14-16	09	Introduce a project, not just a link
16-38	10	WORK + Q&A: What would you like to work on?
38-40	11	What would help you move forward?

40-minute plan: The opening includes discussion and the Post-it activity. Slide 10 protects 22 minutes for work and questions, including a short shared Q&A.

45-minute plan: Add five minutes to slide 10. Close at minutes 43-45.

Keep beside you: Three Post-it notes per person, pens, the HTML, and this run sheet. Ask, "What are you trying to learn or show?"

01 / INTRODUCE / 00-01 MIN

GitHub and portfolios

Your portfolio gives people a way to understand your work beyond the skills listed on your résumé.

[] Introduce the purpose, then move on. Do not tour the whole interface.

Transition: We will use three ideas to keep the advice connected.

02 / DISCUSS / 01-03 MIN

Fluency, legibility, and reach

Doing the work builds your understanding; explaining it helps other people recognize what you can contribute.

[] Define the three terms briefly.

[] Ask what students hope someone will understand about them after visiting their portfolio.

Transition: Start with something you have already done or want to explore.

03 / EXERCISE / 03-06 MIN

What could you work on?

Write a few possibilities, compare them at your table, and choose something you would like to explore today.

- [] Offer three Post-it notes and pens, with a typed alternative.
- [] Ask for an assignment, a curiosity, and something they want to learn.
- [] Invite one or two examples. Do not require a permanent project choice.

Transition: A job description can give you another place to find ideas.

04 / DISCUSS / 06-08 MIN

A job description can suggest your next project

Look for tasks in a posting, then consider a smaller way to practice one of them.

- [] Open the Figma task tab, then the practice tab.
- [] Ask the room what experience the smaller example would help someone gain.
- [] Point to the SDS board for students who want to use another posting.

Transition: Now think about the different capabilities a collection of projects could show.

05 / DISCUSS / 08-09 MIN

Choose projects that show different strengths

Choose projects that add relevant evidence rather than repeating the same exercise with different data.

- [] Give two or three examples from the cards, not all six.
- [] Avoid saying SQL, cloud, or a pull request guarantees differentiation.
- [] Explain that a faculty member, practitioner, or established reference can help calibrate the work.

Transition: The project is only useful to a reader when its purpose and your contribution are understandable.

06 / DEMONSTRATE / 09-11 MIN

Explain the question, your approach, and the result

A useful README explains the question, your contribution, and what the work actually establishes.

- [] Ask what a reader can tell from the Before version.
- [] Reveal After and use the same three questions.
- [] Note that this is a planning example inspired by the Figma task, not work performed for Figma.

Transition: Next, decide how someone will find this project and learn about you.

07 / DEMONSTRATE / 11-13 MIN

Build a presence that helps someone understand you

Your profile introduces you, a project README explains a project, and a separate website is one optional way to bring them together.

- [] Show the About, selected work, and contact structure.
- [] Use the GitHub and website tabs only as needed.
- [] Compare Reggie and Ckalib as different approaches, not portfolio grades.

Transition: Before any of these materials become public, check what you are allowed to share.

08 / DISCUSS / 13-14 MIN

Decide what you can share

Choose a form of evidence that respects the permissions attached to the work.

- [] Distinguish your own shareable work, material that needs permission, and work you cannot publish.
- [] Explain that a permitted case note or a different example can still be useful.

Transition: Once the work is ready to share, give the person some context for opening it.

09 / DEMONSTRATE / 14-16 MIN

Introduce a project, not just a link

Choose one relevant project and explain why you are sharing it with this person or audience.

[] Show one message tab, not every example.

[] Optional: ask students to draft two opening sentences, but let them choose this during work time instead.

[] Invite an outreach question from the room.

Transition: The remaining time is for starting, improving, and getting feedback on your own work.

10 / WORK AND QUESTIONS / 16-38 MIN

What would you like to work on?

Choose the activity that would help you most, work in your own file or tool, and ask questions as they come up.

[] Leave this screen or In practice visible. There is no required route or tracking form.

[] Allow roughly 17 minutes for work and individual questions, then 5 for shared questions.

[] Offer an optional neighbor review: What do you understand? What is still unclear?

[] For technical evaluation, refer to course staff, a technical peer, or provider documentation.

Transition: Save what you have changed and identify what you want to do next.

11 / QUESTIONS AND CLOSE / 38-40 MIN

What would help you move forward?

Before you leave, save the work and make sure you know where to return when you need examples or help.

- [] Invite any remaining questions about their actual profiles and projects.
- [] Point to the field guide, In practice, and Artifact as take-away resources.
- [] A draft, decision, or revision is a valid outcome; publishing is not required.

When someone needs technical evaluation

"I can help you decide what you are trying to learn or show. Let's identify the course resource, faculty member, documentation, or practice environment that can help you check the technical approach."
