

FACILITATOR RUN SHEET

Make your work visible

Times start at Reggie's handoff, after the faculty opening. Keep one student-selected project or question in use throughout.

TIME	SCREEN / MODE	WHAT HAPPENS
00-01 min	01 Orient	Name the purpose and the persistent project.
01-02 min	02 Orient	Explain fluency, legibility, and reach.
02-05 min	03 Exercise	Choose a starting condition; write and circle a note.
05-09 min	04 Watch	Model the Figma task through the measurement brief.
09-12 min	05 Try with us	Tables scope the CSIS task; hear one rationale.
12-15 min	06 Try on yours	Students write a bridge for their own work.
15-18 min	07 Watch	Compare the two explanations with the same questions.
18-21 min	08 Try with us	Pairs identify missing facts, without inventing them.
21-24 min	09 Try on yours	Students write about their own project or plan.
24-26 min	10 Orient	Compare project, profile, and optional website.
26-29 min	11 Model + apply	Model an introduction; students draft two sentences.
29-36 min	12 Independent work	Students work in their own tool. Walk the room.
36-39 min	13 Peer test	Read first, explain a choice, then revise.
39-40 min	14 Reflect	Save the work and name the next action.

45-minute option: Independent work runs 29-40 minutes; peer review runs 40-44; close runs 44-45. Select 45 min in the HTML. Do not add more lecture.

When someone is stuck: Ask what they are trying to learn or show. Offer a nudge, then an example. A paper note or local document works when accounts or Wi-Fi do not.

BEFORE THE SESSION

Set up the room and your browser

Bring three Post-it notes per person, pens, and this guide. The printed student worksheet is an optional alternative, not additional required paperwork.

Prepare the teaching environment

- [] Open the main HTML in a full browser. Confirm that Next, a help button, a timer, and a Markdown download work on the teaching laptop.
- [] Check the projector at the intended zoom. Use Present to hide your personal work card and starting-condition choices. Keep the speaker note closed while speaking.
- [] Distribute the HTML file or an approved hosted link. A local file path on your laptop will not open on a student's laptop.
- [] Check the Figma and CSIS links, student access to the SDS board, and profile examples. Their descriptions remain in the file if the pages are unavailable.
- [] Agree on the 15-20 minute faculty handoff. Select 40 or 45 minutes in the HTML; this changes work and peer timers.

What to watch while facilitating

By minute five, everyone has one selected project, assignment, task, or question. The shared examples teach a move; students then return to their own note. Do not let every exercise become a new project.

During work time, ask: “What are you trying to show or learn?” and “What is the smallest useful finish line?” A question, plan, paragraph, or revision can be read by a partner.

When a student needs technical evaluation

“I can help you decide what you are trying to learn or show. Let’s identify the course resource, faculty member, documentation, or practice environment that can help you check the technical approach.”

Timers do not synchronize across browsers. They start only when pressed, and pause when you leave the activity. Plans must remain visibly distinct from completed results.

01 / THE IDEA / ORIENT / 00-01 MIN

Make your work visible

Today you will choose one piece of work and practice developing it, explaining it, and introducing it to someone else.

[] Introduce the purpose after the faculty handoff.

[] Tell students that an assignment, question, or unfinished project is enough to begin.

Transition: First, here is how projects and a portfolio fit together.

02 / THE IDEA / ORIENT / 01-02 MIN

What a project and a portfolio can help you do

The work builds fluency; explaining what you did helps other people recognize your capability.

[] Explain the three concepts using the definitions on screen.

[] Distinguish GitHub, which can hold work, from a portfolio, which selects and explains it.

Transition: Choose something of your own to keep beside you as we work through these ideas.

03 / THE IDEA / EXERCISE / 02-05 MIN

Choose one project or question to keep working on

Write three possibilities, then circle one that you will keep using throughout the session.

- [] Ask everyone to identify a starting condition; using the on-screen selector is optional.
- [] Start the 90-second timer for three notes. A typed or private equivalent works.
- [] Have students place notes in the middle, compare briefly, and circle one.
- [] Ask one table for a selected example. By minute five, everyone should have something to use.

What should exist: One selected assignment, project, question, or job task.

Transition: Keep your chosen note. Watch how an employer task can suggest a manageable learning project.

04 / FLUENCY / WATCH / 05-09 MIN

Turn an employer task into a project you can practice

Look for a task in a job description, then reduce its scale until you can practice part of it with the access and experience you already have.

- [] Show the Figma task and the dated employer link. Do not review eligibility or every skill requirement.
- [] Reveal the example stages in order. Explain why this is a measurement brief, not a claim to have improved a product.
- [] Ask what a student could learn by choosing measures before asking a model to write code.
- [] Show that the same brief will become our README and sharing example.

Transition: Now your table will try the same move with a different employer task.

05 / FLUENCY / TRY WITH US / 09-12 MIN

Try scoping a project together

Choose one small part of this task that a student could practice, and explain why your version is manageable.

- [] Read the CSIS task, then ask pairs or tables to choose an approach.
- [] Start two minutes for discussion and a shared sentence.
- [] Ask one pair to explain its scope; use the nudge or example only when needed.
- [] Ask students what they can borrow from that reasoning for their own project.

What should exist: A shared practice idea and the reason for its scope.

Transition: Reopen your own note and use the same reasoning on your selected work.

06 / FLUENCY / TRY ON YOURS / 12-15 MIN

Choose the next learning move for your own work

Revisit the work you selected and identify the gap between what you can do now and what you would like to understand or practice.

- [] Point students back to their circled note rather than asking everyone to choose a new job description.
- [] Start the three-minute timer. Students work in their own document or notebook.
- [] Offer a nudge before a full example when someone is stuck.
- [] Invite a brief comparison with a neighbor before continuing.

What should exist: A current starting point, learning goal, and first action.

Transition: You now have a direction. Next we will make the work understandable to someone who was not there.

07 / LEGIBILITY / WATCH / 15-18 MIN

Explain the project with the same three questions

A useful project explanation tells us the problem, your approach and contribution, and what happened without turning a plan into a result.

- [] Show the vague description and ask what a reader cannot tell.
- [] Reveal the revised description, keeping the same three questions on the right.
- [] Open the measurement brief only if needed; it is the evidence behind the revised description.
- [] Point out the distinction between producing a plan and completing a study.

Transition: Try asking these three questions of a different explanation before you revise your own.

08 / LEGIBILITY / TRY WITH US / 18-21 MIN

Ask a writer for the information you need

Before rewriting an explanation, ask for the information that would let a reader understand the work.

- [] Read the shared description, which continues the chart task from the CSIS example.
- [] Give pairs two minutes to choose the most useful clarifying questions.
- [] Hear one question for each part of the framework.
- [] Do not invent missing results or award points for a polished guess.

What should exist: Two clarifying questions grounded in the three-part framework.

Transition: Keep those reader questions in mind as you describe your own work.

09 / LEGIBILITY / TRY ON YOURS / 21-24 MIN

Write an explanation of your own project or plan

Explain the same work you selected, using completed work where it exists and clear future tense where it does not.

[] Start the three-minute timer. Ask students to write in their own notes or README.

[] Remind students with plans to describe intended work and unanswered questions, not fabricated outcomes.

[] Offer the task-only, nudge, and example controls.

[] Ask each student to identify one specific piece of evidence or a next step.

What should exist: A three-to-five-sentence project explanation with accurate work status.

Transition: Now decide where this explanation and any supporting work belong.

10 / LEGIBILITY / ORIENT / 24-26 MIN

Decide where to put the work and its explanation

A project README explains one piece of work; your profile can introduce you and point toward a selection of projects.

[] Distinguish the three surfaces without opening a long setup tutorial.

[] Offer Ckalib's and Reggie's profiles as contrasting interpretations.

[] Point to the browser instructions and sharing-permissions guide.

Transition: A place to put the work is useful. Next, consider how someone might encounter it.

11 / REACH / MODEL + APPLY / 26-29 MIN

Introduce your work in a situation that makes sense

Give a person enough context to understand why you are sharing this project, rather than sending an unexplained portfolio link.

- [] Show one of the two messages using the same measurement brief.
- [] Ask students to choose a real or plausible situation for their own work.
- [] Start 90 seconds to write two opening sentences; compare briefly with a neighbor.
- [] Do not require anyone to send the message or publish the work.

What should exist: Two opening sentences or a plausible sharing plan.

Transition: Use the remaining work time to improve the part that would be most useful to you.

12 / IN PRACTICE / INDEPENDENT WORK / 29-36 MIN

Work on the part that would help you most

Choose a step connected to your existing work and use this time to make a concrete improvement you can explain.

- [] Ask students to keep using the same work rather than selecting a new project from the activity menu.
- [] Start seven minutes in the core session or eleven minutes in the extended session.
- [] Walk the room and ask what they are trying to learn or show. Offer a nudge before an example.
- [] Keep the final reader test and close. Refer technical evaluation to course resources or a technical colleague.

What should exist: One concrete improvement or first action, saved in the student's own tool.

Transition: Stop with enough time for someone else to read what you have and give useful feedback.

13 / IN PRACTICE / PEER TEST / 36-39 MIN

Let another person read before you explain

Let the work speak first, then explain one decision without reading the workshop's template.

[] Hide the prompt or template. Start the three-minute reader test, or four minutes in the extended session.

[] Partner A reads silently, gives specific feedback, and hears one decision explained. Switch roles.

[] Use the final minute to revise one thing. A solo or written version is valid.

[] Ask whether the explanation makes the work and its current status clearer, not whether it looks impressive.

What should exist: Specific feedback, an independent explanation, and one revision.

Transition: Save that revision and name the next action you know how to take.

14 / IN PRACTICE / REFLECT / 39-40 MIN

Save your work and decide what comes next

Before you leave, save what changed and name one next action you know how to take.

[] Ask students to save their own file or commit an appropriate change.

[] Invite a brief response: what changed, and what comes next?

[] Point to the field guide and Artifact for later use.

Transition: The workshop is complete; the same questions can help you with the next piece of work.
